

FAQ: Static balancing valve iDROSET® Series CF

No	Question	Answer
1.	Does the iDROSET CF have to be installed in the return pipe?	Depends on the heating network. It is recommend to install it in the forward, because a magnetite sludge separator would be installed in the return before the boiler, which protects the iDROSET CF from mud and metal deposit. If the system does not allow it in any other way, it is recommended to install a strainer in front of the iDROSET CF , especially in old systems.
2.	How do I choose the right dimension?	You can use our online configuration-tool to determine the dimension; but you should also be based on the existing pipes, because in the past they were often over dimensioned. Problems could arise if the selected dimension is too small.
3.	Can the iDROSET CF also be installed in a one-pipe system?	Yes, it is possible. But it should be noted that the heating network should be known, because there are different types of one-pipe systems with horizontal or vertical distribution (see schemas below). Depending on the type, the installation position is different.
4.	Are insulating shells available for the iDROSET CF ?	Yes, they are available. You find the part numbers on the website or in our catalogues .
5.	Can the iDROSET CF be opened and cleaned?	We advise against this, as it will void the warranty.
6.	The iDROSET CF doesn't show a volume flow.	Is water flowing? Is the direction of the flow correct? Check the inlet for impurities that could block the inlet.
